AMÉLIE ABEL

Hello!
I'm Amélie, an architecture graduate with a strong interest in how spaces shape the way we live, meet, and experience our surroundings. I especially enjoy developing initial ideas into clear architectural concepts that respond thoughtfully to their context.
After completing my Bachelor's degree in Architecture at RPTU Kaiserslautern-Landau, I continued directly with the Master's programme and have now completed my first semester and my first Master's design project.
For me, good architecture combines creativity, functionality, and responsibility to create spaces that are meaningful, timeless, and sensitive to their surroundings. With every project, I aim to explore new ideas and continue growing as a designer.

PROJECTS

BACHELORTHESIS

FORMER CIVIL SERVANTS' DEPARTMENT STORE

The project focused on developing a design proposal for Richard Wagner Street in Kaiserslautern that explores how city centres can be reimagined for the 21st century. The design responds to current challenges such as vacancy, climate change, changing ways of living and working, and increasing competition for urban space. Instead of demolition, the existing high rise and former department store were transformed and integrated into the new concept. The proposal also includes strategies for urban densification, the adaptive reuse of the parking garage and retail spaces, as well as a climate and landscape concept designed to address heat and heavy rainfall.

01

My design sets the ground floor façade back to create an arcade that provides additional space for social interaction and public life. The ground floor is activated by workshops and cafés, while the upper floors accommodate a variety of housing types for different users and lifestyles.

KALKOFEN

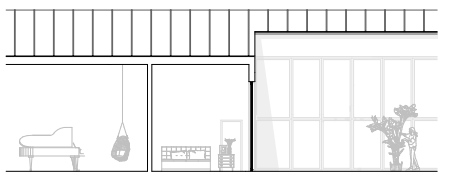

ASTERNWEG 33, KAISERSLAUTERN

The Kalkofen district in the northeast of Kaiserslautern is characterised by post war row housing from the 1950s, much of which still defines the neighbourhood today. The area faces a range of social challenges and has long been considered one of the city's disadvantaged districts. A particular issue is the lack of public spaces and recreational facilities. Apart from a daycare centre, there are very few places that encourage social interaction, community activities, or everyday gathering, contributing to the neighbourhood's social isolation.

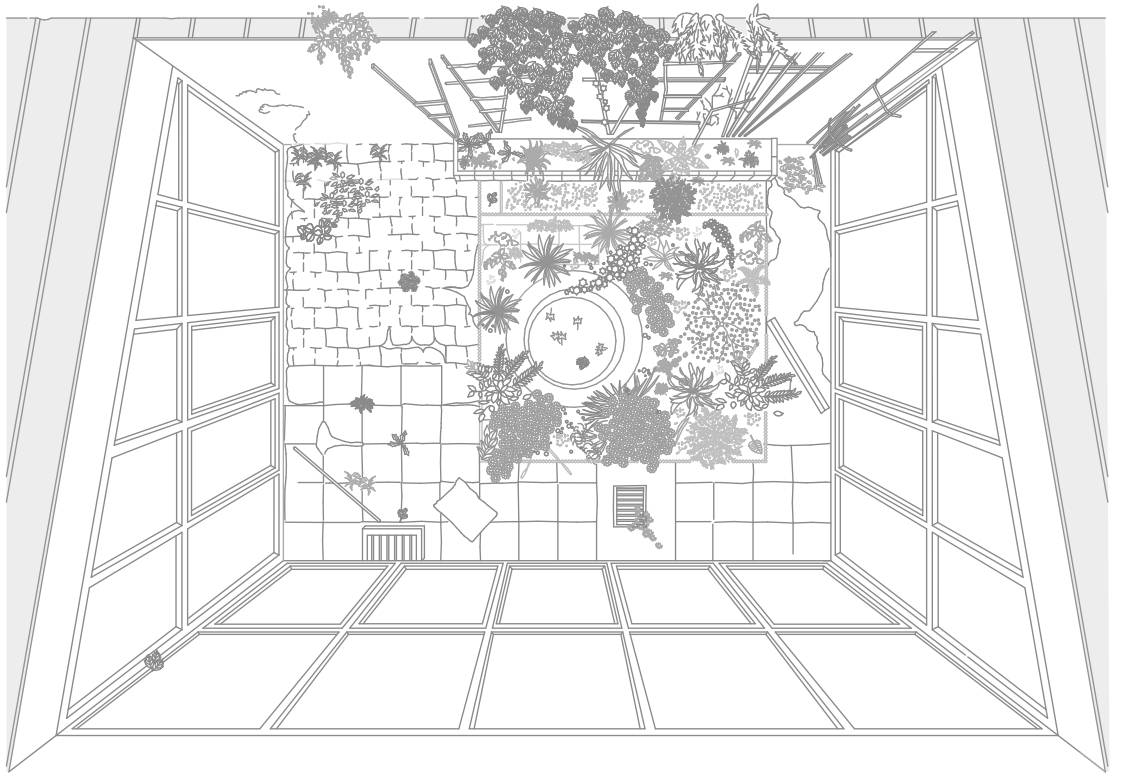

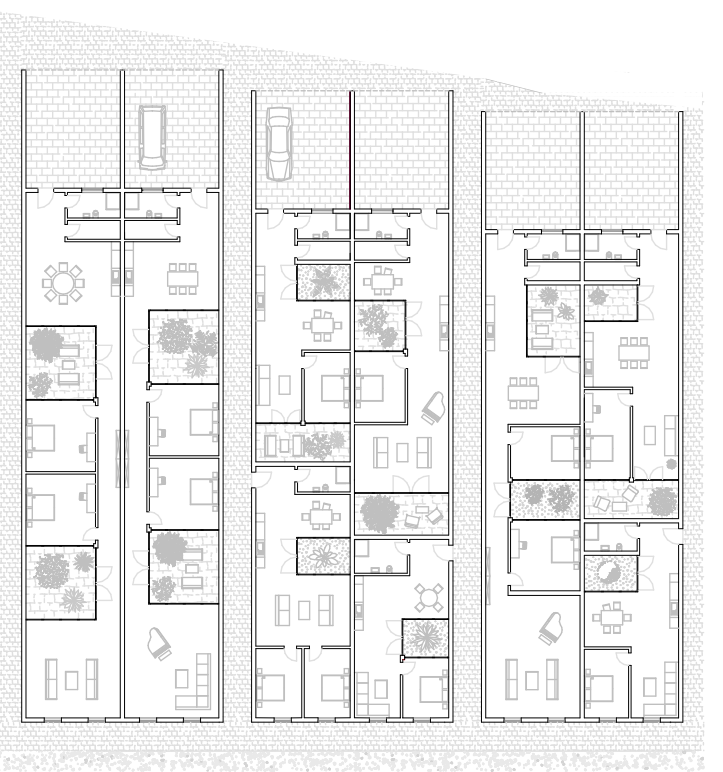

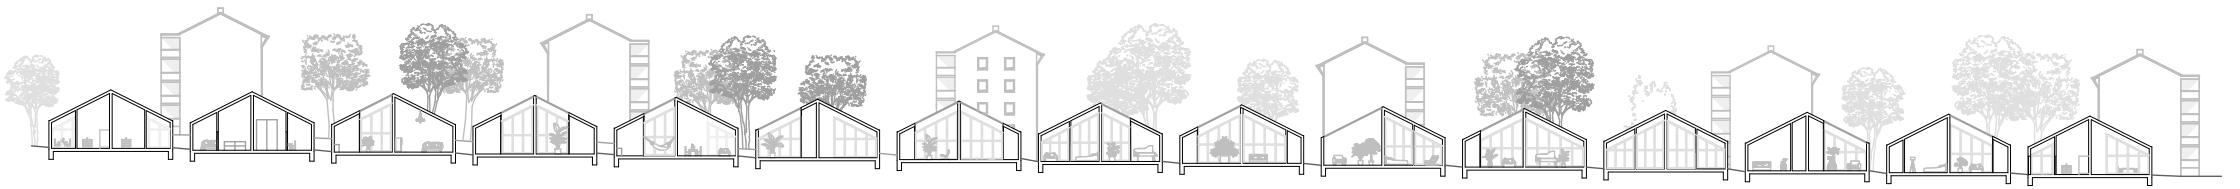

02

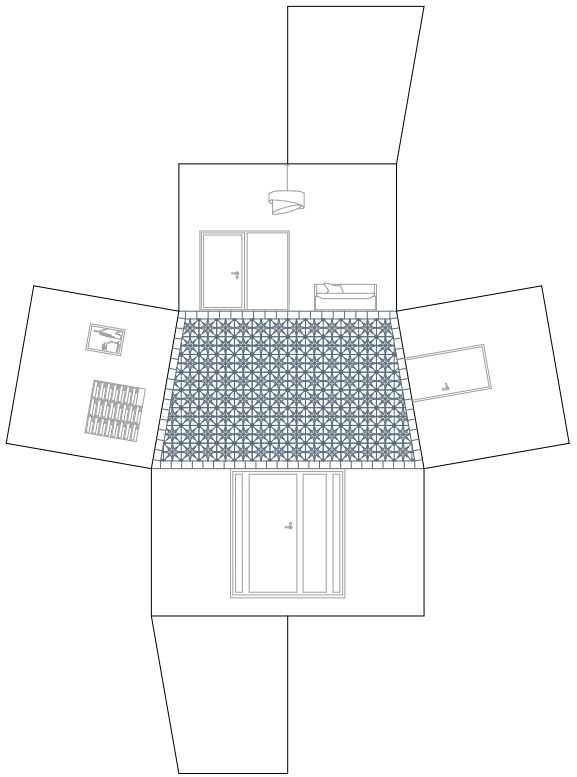

My design introduces new residential buildings with internal courtyards that bring natural daylight deep into the buildings while allowing for an elongated building layout. This approach makes efficient use of the site and creates a vibrant, attractive, and liveable neighbourhood.

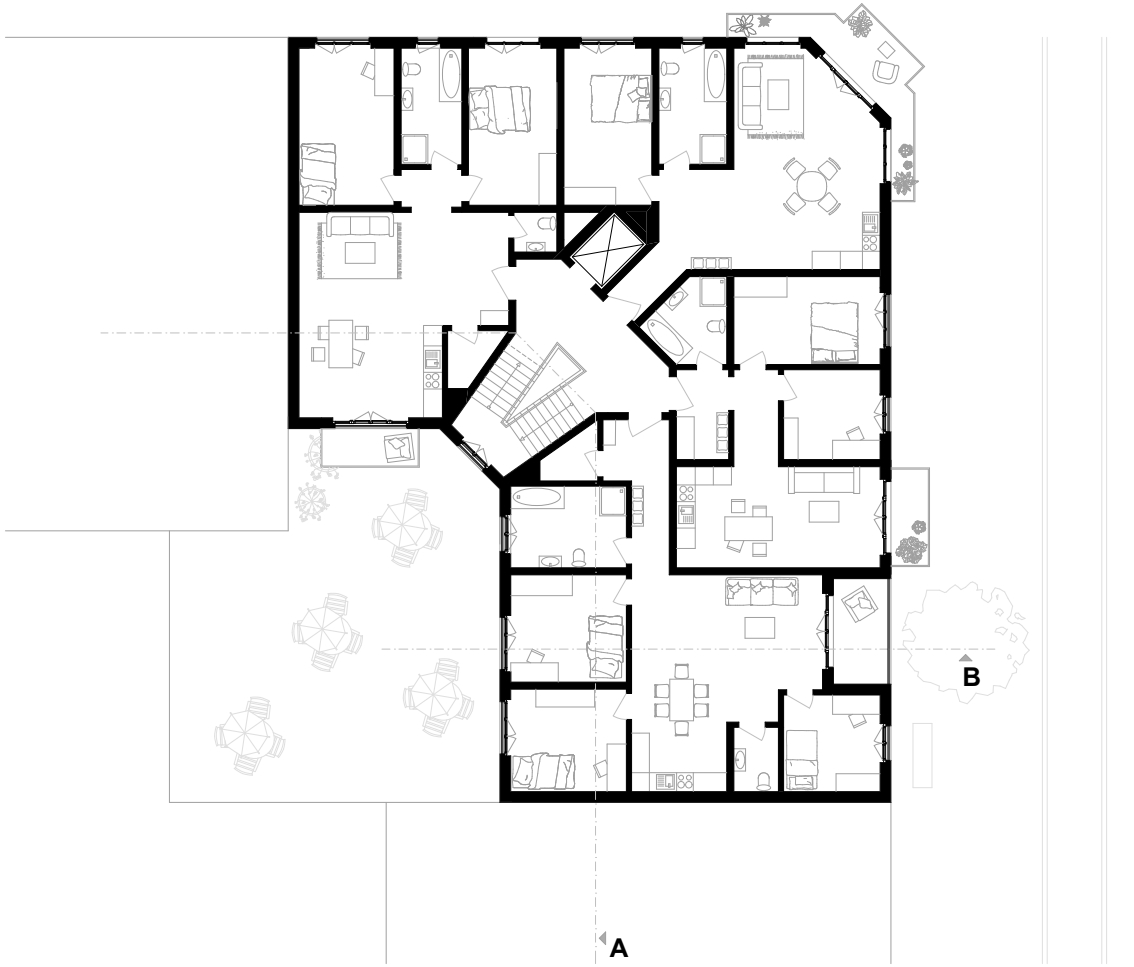

The project involved designing a mixed use building that integrates into the existing urban fabric of Mannheim. Located on a corner site facing a public square, the ground floor accommodates commercial or public functions, while the upper floors provide space for residential or office use. The scale, proportions, and programme were carefully developed to complement the surrounding neighbourhood.
Any adjustments to the building's height or use were intentionally justified to ensure both functional and architectural integration.

MOMENTS

The project involved creating a sectional model of the previously designed building. The model illustrates the structural composition from the foundation to the roof, highlighting the key construction layers in a simplified and reduced representation while communicating the essential structural principles.

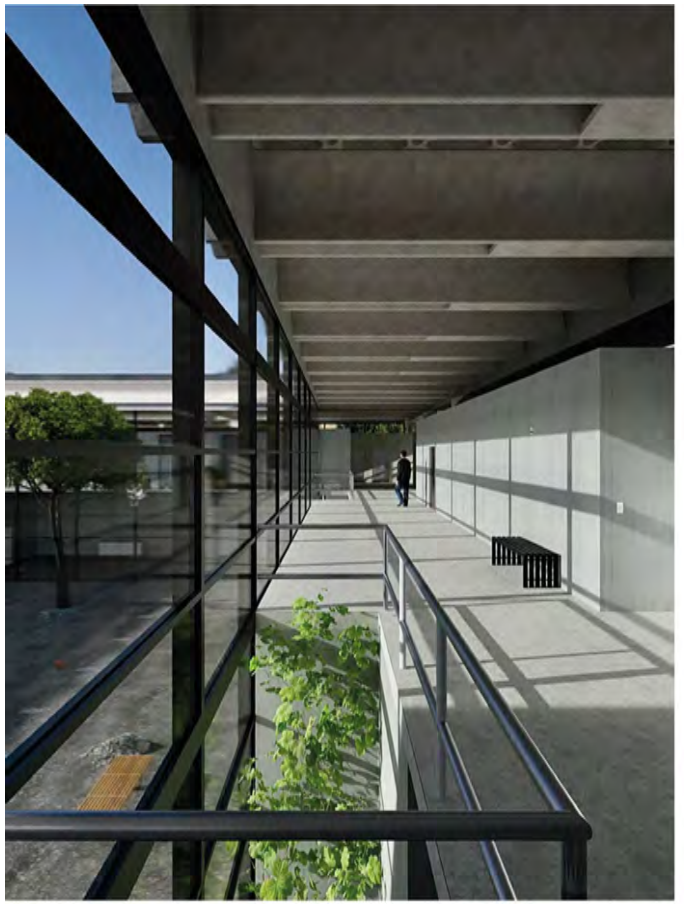

04

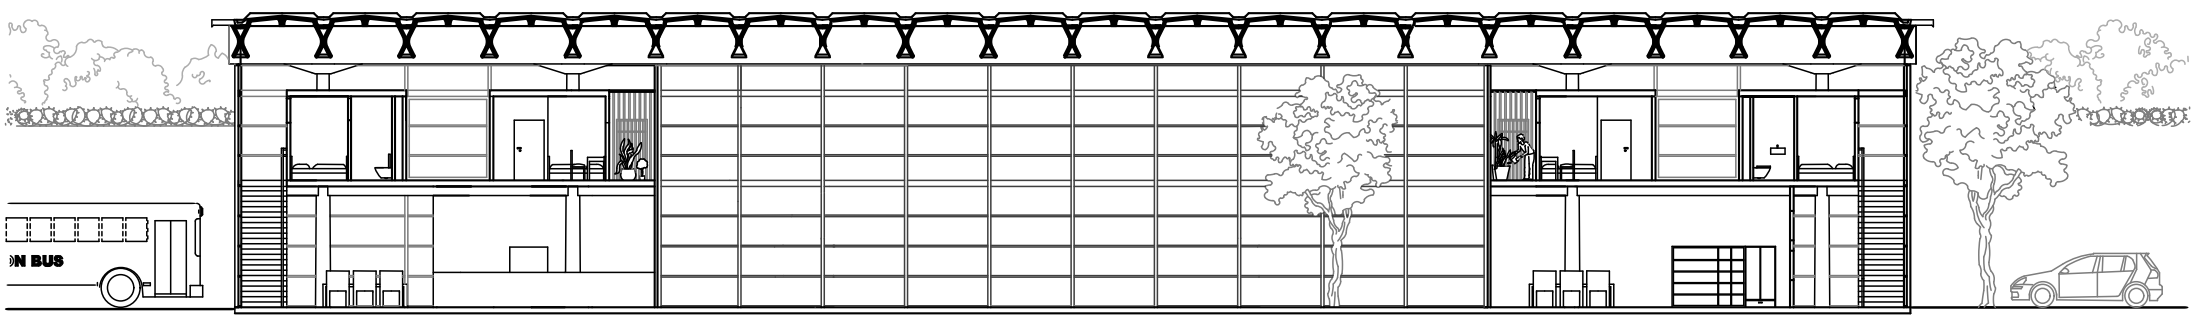

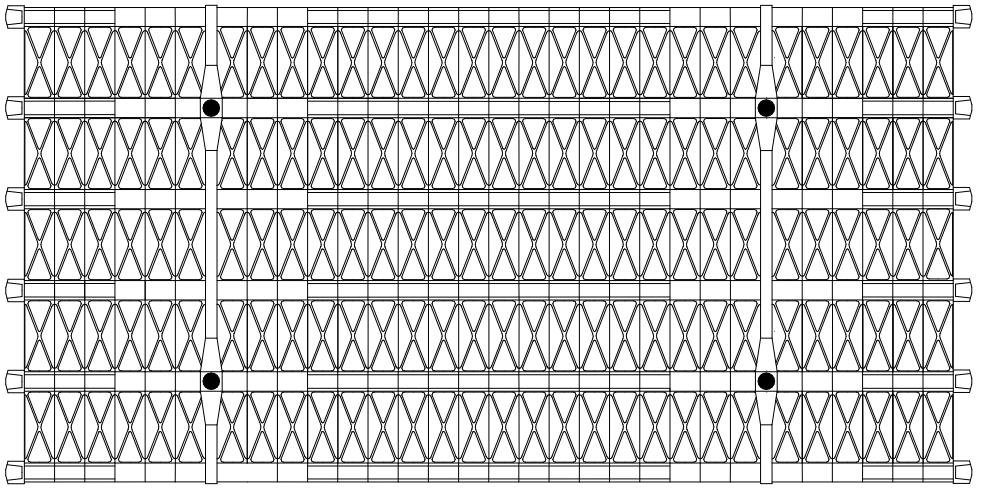

Photographic observations of architecture served as the starting point for exploring spatial qualities such as approach, transition, visual connections, and the use of light. These observations informed the design, translating these architectural qualities into different spatial situations within a prison environment.

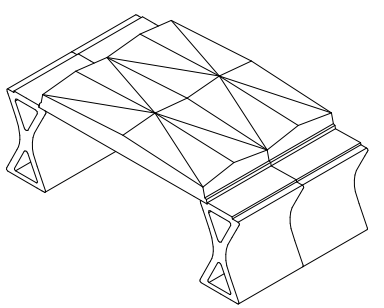

TRANSFORMATION

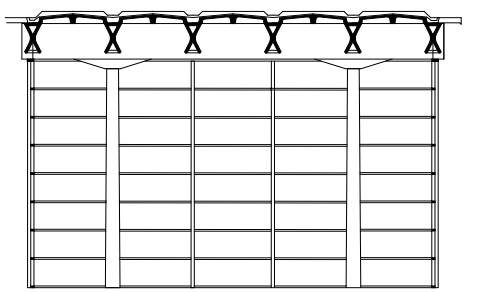

05

I first analysed the load-bearing structure of the Church of Nostra Signora della Misericordia and reconstructed it in a true-to-scale 3D model. Based on this, I developed a modular system that can be flexibly expanded.

In the next phase, I transformed this structure by scaling the modules, expanding the composition, and introducing new spatial elements to create a completely new prison building. The resulting design retains key architectural qualities of the original church while adapting them both functionally and architecturally to its new purpose.
